

OFFLINE BIP39 ENTROPY

2XD8

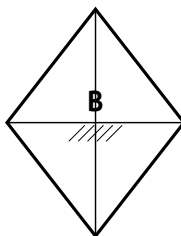

ENTROPY BOOKLET

OPPOSITE-COMPLEMENT FOLD

WHITE ROLE

AND

BLACK ROLE

COMPACT / ADVANCED EDITION

TWO DISTINGUISHABLE STANDARD D8 DICE

PHYSICAL ENTROPY - DETERMINISTIC CHECKSUM

VERIFY BOTH DICE BEFORE USE

PHYSICAL OPPOSITES

1<->8 2<->7 3<->6 4<->5

BEFORE YOU START

INSPECT BOTH ACTUAL DICE. Verify that opposite faces are 1<->8, 2<->7, 3<->6, and 4<->5. If either die differs, do not use this edition.

- Use two visually distinguishable d8 dice. Assign one permanently as WHITE and one as BLACK.
- Use a hard, flat rolling area or dice tray and ensure genuine tumbling.
- Precommit this invalid-roll rule: if either die is off-table, cocked, wedged, or unreadable, discard that entire pair roll and reroll both dice.
- Repeated values and apparent patterns are valid. Never selectively reroll a result because it looks suspicious.

If you lose CARD or MODE before the second roll, discard that incomplete word attempt and restart from the first pair roll.

GENERATE ONE FULL WORD

1. Roll WHITE and BLACK together.
2. Use the CARD SELECT table with the actual readings.
3. Record both the CARD number and the full word NORMAL or MIRROR.
4. Turn to exactly that CARD / MODE page.
5. Roll WHITE and BLACK together again.
6. Use the actual WHITE result as the row and actual BLACK result as the column.
7. Read and record the printed word. The small number is its one-based BIP39 index for auditing.

There is no subtraction, binary arithmetic, modulo, or die-face conversion in this ordinary workflow.

FINAL ENTROPY + CHECKSUM

24 WORDS

Generate 23 full word indices: 253 entropy bits. Then use the FINAL 3 BITS table for one additional physical pair roll of WHITE and BLACK together. Those 3 bits complete the 256-bit entropy.

12 WORDS

Generate 11 full word indices: 121 entropy bits. Then use the FINAL 7 BITS procedure: one CARD SELECT pair roll plus one additional WHITE-only roll. Those 7 bits complete the 128-bit entropy.

CHECKSUM

A deterministic offline checksum tool hashes the completed 128- or 256-bit entropy, takes the first 4 or 8 hash bits, and combines them with the final physical entropy bits to select the last word.

The checksum tool is allowed to calculate; it is not allowed to contribute randomness.

WORKED EXAMPLES

NORMAL

First roll WHITE 2, BLACK 7 gives CARD 15 - NORMAL. Second roll WHITE 6, BLACK 3: turn to CARD 015 NORMAL, use actual row 6 and column 3, and read PREFER (BIP39 index 1359).

MIRROR

First roll WHITE 7, BLACK 2 gives CARD 15 - MIRROR. Second roll WHITE 3, BLACK 8: turn to CARD 015 MIRROR, use actual row 3 and column 8, and read PEACE (BIP39 index 1295).

On a MIRROR page, actual die values are still used directly. The printed page already performs the fold.

Keep WHITE and BLACK roles fixed so the mapping remains deterministic and auditable. If their identities become uncertain during a word, restart that word attempt.

WHAT THE FOLD PROVES

EXACT FAIR-DICE RESULT

Every four-reading tuple is paired with the tuple obtained by replacing every face with its physical opposite. There are no fixed points. The 4,096 raw tuples therefore form 2,048 pairs, and each pair maps to one BIP39 index: exactly $2/4,096 = 1/2,048$ under fair independent rolls. This proves no modulo or rejection bias.

LIMITED BIAS MITIGATION

If a small imbalance is approximately antisymmetric across physical opposite faces, first-order terms from that component cancel when paired tuple probabilities are added.

This does not make arbitrary biased dice perfect. Pair-symmetric bias, pair-to-pair differences, changing distributions, correlation, deterministic throwing, and weak technique can remain. Dice quality still matters. This is not a general-purpose randomness extractor.

Exact $1/2,048$ output probabilities require the fair, independent-roll model.

CARD SELECT

Rows = actual WHITE; columns = actual BLACK

ACTUAL BLACK								
ACTUAL WHITE	1	2	3	4	5	6	7	8

FINAL 3 BITS

After 23 full words, roll WHITE and BLACK together once

Use the actual WHITE row and actual BLACK column. Record the printed three bits. This completes all 256 entropy bits before checksum calculation.

		ACTUAL BLACK							
		1	2	3	4	5	6	7	8
ACTUAL WHITE	1	000	000	000	000	001	001	001	001

FINAL 7 BITS

Direct lookup - cards 01 through 16

After 11 full words: 1. Roll WHITE and BLACK together, then use CARD SELECT; keep CARD and MODE.
2. Roll WHITE only; BLACK is not rolled and no second Black result is used. 3. Use the mode row to choose a 2-bit column. 4. Cross CARD and that column; record the direct 7-bit result.
